Hydrogen can be stored physically as either a gas or a liquid. Storage of hydrogen as a gas typically requires high-pressure tanks (350-700 bar [5,000-10,000 psi] tank pressure). Storage of hydrogen as a liquid requires cryogenic temperatures because the boiling point of hydrogen at one atmosphere pressure is -252.8°C .

Electrochemical energy storage devices, considered to be the future of energy storage, make use of chemical reactions to reversibly store energy as electric charge. Battery energy storage systems (BESS) store the charge from an electrochemical redox reaction thereby contributing to a profound energy storage capacity.

Benefitting from these properties, the assembled all-solid-state energy storage device provides high stretchability of up to 150% strain and a capacity of 0.42 mAh cm^{-3} at a high ...
