

Battery Cell Chemistry: Li-ion NMC Nameplate Capacity (GB2000): 2106Wh Cycle Life (GB2000): 1000 Cycles to 80% Capacity Shelf Life: Charge every 3-6 months; Environmental Discharge Temperature: -4&#176; F to 104&#176; F Charge Temperature: 32&#176; F to 104&#176; F Storage Temperature (Optimal): 59&#176; F to 77&#176; F

The claimed capacity is 2000Wh but the manual does state that the Depth Of Discharge is 10% - so the unit will power off with 10% of battery remaining to protect the battery. Also taking into account the efficiency of the unit which the manual specifies as 88% we should be able to get at least  $2000 \times 0.9 \times 0.88 = 1584\text{Wh}$  of usable capacity.

The Battery Charging Time Calculator is a web-based tool that estimates how long it takes a solar panel to charge a battery completely. Skip to content. Menu. ... battery by the amount of energy produced by the solar panel per hour to calculate the time required to fully charge the battery:  $1200 \text{ Wh} / 1250 \text{ Wh/hour} = 0.96 \text{ hours}$  (or approximately ...

C-rate of the battery. C-rate is used to describe how fast a battery charges and discharges. For example, a 1C battery needs one hour at 100 A to load 100 Ah. A 2C battery would need just half an hour to load 100 Ah, while a 0.5C battery requires two hours. Discharge current. This is the current I used for either charging or discharging your ...

For how long can the 100 Ah battery provide power to appliances with the combined wattage of 51W? Well, 100 Ah battery probably has 12V voltage; that means that at full capacity, the battery stores 1,200 Wh.  $1,200 \text{ Wh} / 51\text{W} = 23.5 \text{ hours}$ . That 100 Ah battery can provide power to the whole system (freezer + LED lights + fan) for about 24h.

It'll be mentioned on the specs sheet of your battery. For example, 6v, 12v, 24, 48v etc. 3- Optional: Enter battery state of charge SoC: (If left empty the calculator will assume a 100% charged battery). Battery state of charge is the level of charge of an electric battery relative to its capacity. For example, enter 80 for an 80% charged battery.

The LiFePO<sub>4</sub> battery in the example above had a 166.67Ah capacity. This is important to know because many LiFePO<sub>4</sub> batteries have a maximum recommended charge rate of 50% of battery capacity in amp hours. This means our battery's max charge rate is around 83.33 amps, and we can design our solar power system so we don't exceed that limit.
