41 critical microsoft windows kernel power system server 2012 r2

What is kernel power event ID 41?

When a Windows-based computer starts,a check is performed to determine whether the computer was shut down cleanly. If not,a Kernel Power event ID 41 message is generated. An event ID 41 is used to report that something unexpected happened that prevented Windows from shutting down correctly.

How do I know if my computer has a critical kernel power 41?

Check the RAM . Use a memory checker to determine the memory health and configuration. Verify that all memory chips run at the same speed and that every chip is configured correctly in the system. Hello, I'm facing an Critical Kernel Power 41 event on windows server 2019, I have checked the power of the system it seems good.

What happens if a computer restarts and generates event ID 41?

The computer restarts and generates Event ID 41,but the BugcheckCode and PowerButtonTimestamp values are zero. In such cases,something prevents Windows from generating error codes or from writing error codes to disk.

Dobry`j den` kollegi! Segodnya na odnoj iz moej virtualok vy`letela oshibka ? Microsoft-Windows-Kernel-Power (41)? No ne ...

what power plan are you running in settings/system/power, click on the Additional power settings link under related settings? Are you on high performance? i see lots of pc that can cope with running full speed but crash at idle, it seems odd to me. you might want to run HWINFO and log system performance to see if any sensors offer a clue.

A driver has inadvertently, or deliberately, modified critical kernel code or data. Microsoft Windows Server 2003 with Service Pack 1 (SP1) and later versions of Windows for x64-based computers do not allow the kernel to be patched except through authorized Microsoft-originated hot patches.

If event 41 is logged because power to the computer was interrupted, consider obtaining an uninterruptible power supply (UPS) such as a battery backup power supply. An underpowered or failing power supply may cause this behavior.

Checked the power settings to make sure the hard drive will not sleep, nor will the server. Checked the server events around the crash time, but no event points towards anything that would tax the system or pull too much power (i.e. a storage backup). Nor are there any user inputs that would cause this, so far as I can tell.

Event Viewer logs indicates Event ID 41: "The system has rebooted without cleanly shutting down

first". This event indicates that some unexpected activity prevented Windows from shutting down correctly.

4. The power cable between the mains power socket and the computer becomes disconnected at either end. 5. A power surge or lightning strike occurs. Your computer should connect to an uninterruptible power supply unit, which then connects to the mains supply. If an incident occurs you will have to reset the uninterruptible power supply unit.
