

What is power system protection?

Power system protection is a branch of electrical power engineering that deals with the protection of electrical power systems from faults [citation needed] through the disconnection of faulted parts from the rest of the electrical network.

What is a power system protection scheme?

The objective of a protection scheme is to keep the power system stable by isolating only the components that are under fault, whilst leaving as much of the network as possible in operation. The devices that are used to protect the power systems from faults are called protection devices. Protection systems usually comprise five components

What devices are used to protect power systems from faults?

The devices that are used to protect the power systems from faults are called protection devices. Protection systems usually comprise five components Communication channels to allow analysis of current and voltage at remote terminals of a line and to allow remote tripping of equipment.

What is protection system dependability?

Protection system dependability is achieved by ensuring that the protective relays and their application within the overall protection system operate when required. Summary Power system protection systems are referred to as secondary equipment, as the primary equipment is transformers, lines, generators, capacitors, breakers, disconnectors.
