Abstract: With the widespread use of electrochemical energy storage, safety accidents in energy storage systems occur frequently. In the energy storage system, once the thermal runaway of lithium-ion batteries occurs, the combustible fumes are very simple to ignite, leading to fire and explosion mishaps.

H₂ and CO are regarded as effective early safety-warning gases for preventing battery thermal runaway accidents. However, heat dissipation systems and dense accumulation of batteries in energy-storage systems lead to complex diffusion behaviors of characteristic gases. The detector installation position significantly affects the gas detection time.
