

Benefits of independent energy storage

What are the benefits of energy storage?

There are four major benefits to energy storage. First, it can be used to smooth the flow of power, which can increase or decrease in unpredictable ways. Second, storage can be integrated into electricity systems so that if a main source of power fails, it provides a backup service, improving reliability.

What are the benefits of grid-connected energy storage?

Grid-connected energy storage provides indirect benefits through regional load shaping, thereby improving wholesale power pricing, increasing fossil thermal generation and utilization, reducing cycling, and improving plant efficiency.

What are the benefits of a storage system?

Second, storage can be integrated into electricity systems so that if a main source of power fails, it provides a backup service, improving reliability. Third, storage can increase the utilization of power-generation or transmission and distribution assets, for example, by absorbing power that exceeds current demand.

Why do companies invest in energy-storage devices?

Historically, companies, grid operators, independent power providers, and utilities have invested in energy-storage devices to provide a specific benefit, either for themselves or for the grid. As storage costs fall, ownership will broaden and many new business models will emerge.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.
