What is buck boost converter?

The buck boost converter is a kind of direct current to direct current converter and it is called as a chopper, that may provide a voltage at output terminal that is higher than or lower than the voltage at input terminal, respectively. The source voltage is connected to a controlled power semiconductor element.

What is the design equation of buck boost converter (buck boost)?

The design equation of converter (buck boost) is as follows: let's consider the power rating of the converter (buck boost) is "  $P$  ", "  $V_{in}$  " is the voltage at input of the buck boost converter, and "  $V_{out}$  " is the voltage at output of the buck boost converter.
