The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy E according to (Equation 1) $E = \frac{1}{2} I \omega^2$ [J], where E is the stored kinetic energy, I is the flywheel moment of inertia [kgm²], and ω is the angular speed [rad/s]. In order to facilitate storage and extraction of electrical energy, the rotor ...

Latent heat storage systems use the reversible enthalpy change Δh_{pc} of a material (the phase change material = PCM) that undergoes a phase change to store or release energy. Fundamental to latent heat storage is the high energy density near the phase change temperature t_{pc} of the storage material. This makes PCM systems an attractive solution for ...
