Each contingency analysis takes about 50-100 ms on an ordinary computer. Hence, it is obvious that the computational workload is beyond what a single personal computer can achieve for real-time operation. This has lead researchers to turn to high performance computing plat-forms in order to accelerate power grid contingency analysis. The ...

The PSCR algorithm is illustrated below: Step-1: Read the network data. Step-2: The load flow simulation is performed and base case voltage, power flows are noted. Step-3: The contingency is simulated one by one and the voltage, power flows are computed. Step-4: The VDI is calculated using (1). Step-5: The PDI is calculated using (2) and (3). Step-6: The OI is calculated using ...
