

Disc brake accumulator

"When the engine is stopped, the accumulator has a reserve of hydraulic pressure than can provide several safe stops. After the reserve is used, the brakes will operate as normal manual brakes. With the high-pressure brake assist available, you may consider using a less aggressive brake pad for longer service intervals," Nix stated.

Brake application stage: Each brake accumulator reduces fluid pressure. Due to this, the control valve core moves to the right under the action of the control valve spring 3 and pressure regulating spring 4. Since the pressure regulating spring 4 sustains a certain amount of compression, therefore, the one-way valve is not actuated until the ...

The results show that the pressure rise time is 0.1 s, the pressure drop time is 0.1 s when the friction disc contacts with the brake disc, and the brake pressure rise can be divided into three stages when the brake disc is unloaded; the accumulator can perform about 4 brakes until the next filling, and the piston reaches the limit position ...

The leakdown of the accumulator can be checked by pumping the brakes several times while the engine is running, then shutting it off. Let the car sit for about an hour, then try the brakes without starting the engine. You should get two or three soft brake applications before it takes more effort to push the pedal.

A disc brake has a disc that turns with the wheel. The disc is straddled by a caliper, in which there are small hydraulic pistons worked by pressure from the master cylinder. The pistons press on friction pads that clamp against the disc from each side to slow or stop it. The pads are shaped to cover a broad sector of the disc.
