

Over the last decade, there has been significant effort dedicated to both fundamental research and practical applications of biomass-derived materials, including electrocatalytic energy conversion and various functional energy storage devices. Beyond their sustainability, eco-friendliness, structural diversity, and biodegradability, biomass-derived materials provide ...

Lithium-ion capacitors (LICs) of achieving high power and energy density have garnered significant attention. However, the kinetics unbalance between anode and cathode can impede the application of LICs. Vanadium nitride (VN) with a high theoretical specific capacity ($\sim 1200 \text{ mAh/g}$) is a better pseudocapacitive anode to match the response of cathode in LICs. ...

[@article{Xiong2023ADS, title={A dual-carbon structured molybdenum selenide composites controlled via interface engineering and chemical bonding to attain high initial coulombic efficiency and rate capability of potassium-ion batteries}, author={Shuangsheng Xiong and Shengmei Wang and Zhuguo Li and Zhengguang Zhang and Hengyu Liu and Jing Wang ...](#)

Dual doping of boron (B) and nitrogen (N) provides an effective strategy to tailor chemical properties and electron distributions in the carbon plane, as well as customize the energy storage ...

Dual-carbon batteries (DCBs) with both electrodes composed of carbon materials are currently at the forefront of industrial consideration. This is due to their low cost, safety, sustainability ...

2 Dual-Ion Batteries, Metal-Ion Batteries and Supercapacitors. Electrochemical energy storage devices (e.g., rechargeable batteries and supercapacitors) in general have four main components: the negative electrode (anode), the positive electrode (cathode), the separator in between the two electrodes, and an electrolyte.

The continuous increase in global temperatures and frequency of extreme weather events underscore the urgency of achieving "dual carbon" goals. Systematically examining the textual characteristics of energy policies under the "dual carbon" framework, synthesizing the implementation pathways of "dual carbon" initiatives contribute to enhancing ...

Nitrogen (N-) doped hierarchical porous carbon (NHPC) possesses the following characteristics: a large specific surface area, high conductivity, and active N doping, which are of great significance to improve the capacitance and long-term application stability of energy storage devices, such as batteries and supercapacitors. 6-12 On the one ...

For the efficient use of solar and fuels and to improve the supply-demand matching performance in combined heat and power (CHP) systems, this paper proposes a hybrid solar/methanol energy system integrating

solar/exhaust thermochemical and thermal energy storage. The proposed system includes parabolic trough solar collectors (PTSC), a ...

limited energy storage capacity. This could offer a type of seasonal storage of renewable energy. CO₂ use may appeal to society more readily than other aspects of carbon capture, use, and storage (CCUS), smoothing the pathway to public acceptance. For example, a mattress made with CO₂ captured from a cement plant could

Seawater batteries are unique energy storage systems for sustainable renewable energy storage by directly utilizing seawater as a source for converting electrical energy and chemical energy. This technology is a sustainable and cost-effective alternative to lithium-ion batteries, benefitting from seawater-abundant sodium as the charge-transfer ...

The inclusion of SA or nD can be practically adopted by the preparation of solar-thermal-energy storage. Interconnected 3D networks in carbon materials facilitate both ... efficiency direct photothermal conversion and storage owing to dual-functional synergy. ... molten PCM. Owing to the high energy-storage density and stability of PCB-20, it ...

The X-ray diffraction (XRD) patterns of the synthesized NPC@MoS₂, MoS₂/MXene, and NPC@MoS₂/MXene samples were presented in Figure 1a. Diffraction peaks corresponding to the (100) and (110) planes of MoS₂ (JCPDS 37-1492) were clearly observed in all synthesized samples, indicating the successful sulfidation of the PPy-PMo₁₂. Notably, the ...

Advanced Energy Materials published by Wiley-VCH GmbH Review Rechargeable Dual-Carbon Batteries: A Sustainable Battery Technology Mike Tebyetekerwa,* Timothy T. Duignan, Zhen Xu, and Xiu Song Zhao* DOI: 10.1002/aenm.202202450 heavily on rechargeable lithium-ion batteries (LIBs). Yet, LIBs face two key challenges: the ever-increasing cost of

Two-dimensional (2D) mesoporous materials (2DMMs), defined as 2D nanosheets with randomly dispersed or orderly aligned mesopores of 2-50 nm, can synergistically combine the fascinating merits of 2D materials and mesoporous materials, while overcoming their intrinsic shortcomings, e.g., easy self-stacking of 2D materials and long ion transport paths in ...

Nowadays, the energy crisis and environmental pollution have attracted much attention [1], [2]. Various new types of energy storage devices are springing up like mushrooms and developing rapidly, including potassium-ion batteries (KIBs) [3], [4]. With the deepening of research, KIBs are expected to replace

lithium-ion batteries (LIBs) to make up for their ...

The exploration of renewable energy in the twenty-first century emerged as the world-leading movement to support energy sustainability, leading to the paramount necessity for energy storage systems (ESSs). The porous carbon-derived electrode has been a long-pursued aim in supercapacitor applications, which feature their availability, renewability, environmental ...

Compressed air energy storage (CAES) processes are of increasing interest. They are now characterized as large-scale, long-lifetime and cost-effective energy storage systems. Compressed Carbon Dioxide Energy Storage (CCES) systems are based on the same technology but operate with CO₂ as working fluid. They allow liquid storage under non ...

For the electrodes, the large-surface-area dual-carbon electrodes with different kinds of functional groups are rich in active sites for energy storage and have good contact with the electrolyte. Assembled with the electrodes and the electrolyte, SSCs exhibit the maximum energy density of 2.1 W h kg⁻¹ at the power density of 1.62 W kg⁻¹.

Herein, we extend the concept of dual-carbon devices to the energy storage devices using carbon materials as active materials in both anode and cathode, and offer a real ...

Aiming at the grid security problem such as grid frequency, voltage, and power quality fluctuation caused by the large-scale grid-connected intermittent new energy, this article investigates the life cycle assessment of energy storage technologies based on the technical characteristics and performance indicators. First, the new power system under dual-carbon target is reviewed, ...

Currently, low-cost energy equipment with high energy density and power density has become increasingly important in the field of energy storage. Potassium-based dual carbon batteries (K-DCBs ...

Here, a hierarchically divacancy defect building platform is reported for effectively biomass-transferred and highly interconnected 3D dual-activated porous carbon fibers (DACFs) based on the internal-external dual-activation function of the pre-embedded KOH and CO₂ molecular. This uniquely interconnected frameworks not only fully provide ...

Advanced Energy Materials is your prime applied energy journal for research providing solutions to today's global energy challenges. ... The concept of dual-interfering chemistry contributes to achieving low-cost and high-performance hard carbon for fast and durable sodium storage. Conflict of Interest.
