What is energy power monitoring software?

Energy power monitoring software offers control capabilities that can help reduce energy-related costs.

What is a power monitoring system?

For this category of consumer, monitoring systems are used to quickly identify and resolve problems occurring on their electrical system. Because power monitoring systems are "permanently installed," they operate on a 24/7 basis.

What is an electrical power monitoring system (EPMS)?

Electrical power monitoring systems (EPMS) make visible the often-overlooked data and health of electrical distribution systems. Typically EPMS is comprised of meters and software installed on a server. Moreover, they offer physical means of communication between the meters and server. Who benefits from EPMS?

What are the components of a power monitoring system?

The three primary components of a power monitoring system include: 1) discrete metering devices to record data, 2) software to accumulate, manage, and display the data, and 3) a communications interface between the software and metering devices.

Which power monitoring system should I Choose?

There are many flavors of EPMS. APT recommends Schneider Electric's Power Monitoring Expert as it offers robust features and proven market longevity. PME is a fully-fledged, heavily tested platform that stands alone or integrates with building management systems to add even more value.

Do you need an electrical power monitoring system?

More than just meters can be included as well. For instance, emergency generators, relays, UPSs, ATSs, sequence of event recorders, and many more devices can be monitored, logged, and displayed. In other words, no matter what consumers would like to leverage for managing energy usage, an electrical power monitoring system can help.
