

Energent microsteam turbine power system

What is a microsteam turbine power system?

The Microsteam Turbine Power System is a compact, efficient power system that generates electricity from pressure energy previously wasted in the steam pressure reducing valves of buildings. This power system, which can be installed through a standard doorway, produces up to 275 kW of electrical power.

What happens when a microsteam turbine is shut down?

. When the turbine is shut down, the PRV automatically resumes steam. The power generated. The Microsteam Turbine is in commercial operation and has been independently tested at the United Techno

How long does a microsteam turbine last?

Under many conditions, the Microsteam Turbine will pay for itself in two to three years. As an example, if the steam load is 13,500 lb/h and the pressure is reduced from 150 psig to 30 psig, the Microsteam Turbine will generate of \$0.15/kWh and a steam cost of \$0.015/lb, the net savings would be calculated as follows: NET SAV

What is the microsteam turbine power system?

The Microsteam Turbine Power System efficiently converts your wasted steam energy into electric power. The turbine. This efficient, compact power system generates electricity from previously wasted steam energy in buildings and plants. Any application having steam boilers or steam service with press

Energent Corporation is focused on applying revolutionary turbine technology to exploit the huge resource of wasted energy to produce useful power and products for society. An example of this technology is the Microsteam Turbine, a high-efficiency back pressure steam turbine.

The turbine is the technological basis for the Microsteam Turbine, and has been applied to both process and geothermal applications. Variable Phase Turbine A hermetic turbine generator that generates power from two-phase, transcritical, and single-phase expansions.

implementing efficient and cost effective means to convert lost energy into useful power. Energent Corporation was created to achieve this new paradigm of energy recovery. ... Microsteam Turbine Power System -- 275 kW power system utilizing the Euler Turbine for back pressure steam letdowns to replace existing pressure reducing valves (PRVs).

Energent has use of extensive manufacturing and testing facilities. Five-axis milling machines are used to produce research turbines. We manufacture and test complete Microsteam Turbines at our factory before shipping to customers. A Variable Phase Turbine test system is installed on site and used to evaluate

Energent microsteam turbine power system

nozzle and turbine geometry.

A Hermetic Variable Phase Turbine was provided by Energent for an ORC system that recovered waste heat from an incinerator. The process design and control logic were also performed by Energent. The 200 kWe unit used the working fluid, R134A, to cool the generator and lubricate the bearings so that no external seals were required.

Our job is not done until the product or system is qualified and has manufacturing, distribution, and service channels in place. The Microsteam™ Turbine Power System, for example, was invented, developed, and demonstrated by Energent, which currently manufactures, sells and services the systems.

Details and specifications about the Microsteam™ Turbine Power System, a high efficiency back pressure steam turbine designed to replace common Joule-Thomson pressure reducing valves. ... A full list of Energent's two-phase turbine installations and testing experience.

A variation of Energent's Microsteam™ Turbine has been successfully commissioned in a geothermal Kalina cycle in Taiwan ... an article titled "Superheated Steam Makes the Grade in Ivy League" about Princeton University's installation of two Microsteam™ Turbine Power Systems. The units were sold through Carrier Corporation.

Energent Corporation has a wealth of experience in fields ranging from geothermal power to oil and gas processes. Energent technology has been deployed worldwide, producing and recovering megawatts of power. Microsteam™ Turbine Installations. A reference of Microsteam™ Turbine Power System installations across the United States.

Microsteam™ Turbine Power System - Energent Corporation. EN. English Deutsch Français Español Português Italiano Român Nederlands Latina Dansk Svenska Norsk Magyar Bahasa ...

describe Energent's Microsteam™ Turbine. This efficient, compact power system generates electricity from previously wasted steam energy in buildings and plants. Any application having ...

In other industrial processes, low pressure steam is often used for heating, cooling, or other processes. When high pressure steam from a boiler or district system is dropped in a pressure reducing valve, recoverable energy is wasted. Energent's Microsteam™ Turbine Power System generates electricity by replacing these pressure reducing valves ...

Commercial buildings using steam for heating or cooling can generate power by replacing pressure reducing valves with the Microsteam Turbine. The power system is configured in a vertical arrangement, minimizing the system's footprint allowing for installation in crowded equipment rooms where space is limited.

Energent microsteam turbine power system

Commercial buildings using steam for heating or cooling can generate power by replacing pressure reducing valves with the Microsteam Turbine. The power system is configured in a vertical arrangement, minimizing the system's footprint allowing for installation in crowded equipment rooms where space is limited.

The turbine is the basis of the Microsteam Turbine and has been applied to power generation from geothermal resources. The cutaway shows an Euler Turbine developed for a geothermal project in Germany.

Energent Corporation October 26th, 2011 Power System Working Fluid R134a Cycle Type Liquid - Variable Phase cycle Turbine Type Two-Phase Axial ... Microsteam Turbine -275 kW Euler Turbine Vapor . Kalina Cycle for Low Temperature Geothermal 2 1 3 4 1 2 4 3 .

mental results of operating the first two-phase closed cycle power system with a Variable Phase Turbine will be presented. Introduction Low temperature geothermal resources, enhanced geothermal ... Energent corporation Typical ORC Thermodynamic Cycle 60 80 100 120 140 160 180 200 220 0% 10% 20% 30% 40% 50% 60% Heat Transfer Temperature (°F)

Details and specifications about the Microsteam Turbine Power System, a high efficiency back pressure steam turbine designed to replace common Joule-Thomson pressure reducing valves.

Commercial sales of the Microsteam Turbine and Euler turbine are conducted from Energent's Santa Ana, California headquarters and by sales representatives in Asia and Europe. ... Microsteam Turbine power systems have been installed in the Rolex Building, 7 World Trade Center and other buildings in Manhattan. Other clients include Con ...

The Variable Phase Turbine is a patented, hermetic turbine generator that generates power from two-phase, transcritical, and single-phase expansions. It is the basis for the Variable Phase cycle . Energent has designed Variable Phase Turbines for process applications including LNG, ethylene, and ammonia production, as well as other industrial ...

A micro steam turbine generator is a small-scale power generation unit that uses steam to turn a turbine and generate electricity. Just like its larger counterparts, it works on the principles of the Rankine cycle, turning thermal energy into mechanical and then electrical energy. Q4: How efficient is a micro steam turbine?

Microsteam Turbine Power System - Energent Corporation. EN. English Deutsch Français Español Português Italiano Român Nederlands Latina Dansk Svenska Norsk Magyar Bahasa Indonesia Türksçe Suomi Latvian Lithuanian ?esk ...

Energent turbine powers Taiwan's first geothermal Kalina cycle power plant. ... The Euler Turbine that was

Energent microsteam turbine power system

installed is a modified version of the Microsteam™ Turbine Power System for use with the ammonia-water mixture. The heat source for the cycle is classified as a low-temperature geothermal resource, with well temperatures near 230 degrees ...

Commercial buildings using steam for heating or cooling can generate power by replacing pressure reducing valves with the Microsteam™ Turbine. Industrial Applications Industries with waste heat from diesel engines, flue gases, and other sources, or excess steam pressure for heating and cooling processes can benefit from Energent's novel energy ...

Using the Micro Steam Turbine Generator, they may save a significant amount of energy. The small steam turbine produces more electricity with the same fuel input as conventional steam turbines in the output range of up to 300 kW. Because of the turbine's low life-cycle costs, electricity prices can be lowered even in single-shift operation.

The Microsteam Turbine Power System, a high-efficiency back pressure steam turbine, produces valuable electricity from wasted pressure energy. Team; ... Control panels mounted away from skid (Energent supplies, customer installs) Power Requirement: 60Hz, 440-480 VAC (Std) 50Hz, 380-400 VAC (Option) ** Electricity Cost: USD / kWh *** Stream Cost
