How do battery energy storage systems work? Simply put, utility-scale battery storage systems work by storing energy in rechargeable batteries and releasing it into the grid at a later time to deliver electricity or other grid services. Without energy storage, electricity must be produced and consumed at exactly the same time.

An AC-coupled system has to go through three lossy conversions to produce backup solar power: PV (DC) to backup load panel (DC to AC) to energy storage (AC to DC) to backup load panel (DC to AC). DC-coupled systems only go through one DC to AC conversion: from the DC-storage system and PV array through a single inverter to the AC-backup load panel.

Power electronics-based converters are used to connect battery energy storage systems to the AC distribution grid. Learn the different types of converters used. The power conditioning system (PCS) only makes up a small portion of the overall costs for lithium-ion and lead-acid battery-based storage systems, as shown in Figure 1.
