Flywheel energy storage is a method for storing energy using a rapidly spinning flywheel. The flywheel, which generally spins in a vacuum, stores energy as rotational energy. Energy can be removed from the system or added to the system by means of an electric motor/generator. Flywheels spin at a very high number of revolutions per minute (RPM ...

The amount of energy stored, E , is proportional to the mass of the flywheel and to the square of its angular velocity is calculated by means of the equation $E = \frac{1}{2} I \omega^2$ where I is the moment of inertia of the flywheel and ω is the angular velocity. The maximum stored energy is ultimately limited by the tensile strength of the flywheel material.
