Inverters tend to be designed for high temperature operation and are usually only protected from the sun with a shade. I'm going to guess that at 8000W of input power, 3% of that is lost as heat (let's assume the inverter is 97% efficient). So, that's 240W of heat that has to be dissipated at 3.414 BTU / Watt equals 819 BTU per hour.
