How can lithium be conserved?

Water conservation: Implementing technologies and practices that reduce the amount of water used in the extraction and processing of lithium. Renewable energy: Using renewable energy sources such as solar and wind to power the extraction and processing of lithium.

Where is lithium produced?

Notably, downstream raw material refining and manufacturing for all renewable energy technologies associated with lithium (e.g., energy generation or storage) are chiefly concentrated in China.

Why is lithium mining so expensive?

Jake S. Yeston and Marc S. Lavine Lithium mining is energy intensive and environmentally costly. This is because lithium ions are typically present in brines as a minor component mixed with physiochemically similar cations that are difficult to separate.

Why is lithium mining a problem?

This can occur through land and energy usage competition, and the displacement of communities in favour of large mining firms (e.g., Geenen, 2014; Hilson et al., 2020). The situation is worsened by inherent information asymmetries and knowledge gaps regarding lithium technology, its extraction and processing (Agusdinata et al., 2018).

How much does it cost to mine lithium?

Little can be said about processing costs. Whabouchi produces mainly lithium hydroxide monohydrate from a mineral with 1.46% of Li_2O . Keliber produces lithium carbonate from a mineral with 1.11% of Li_2O . Both costs are around 54.3 \$/t of ore, but this figure can be only considered as orientative for a generic lithium mining investment.

The energy used by mining machinery creates climate pollution like carbon dioxide, which warms the planet. A 2021 study found that lithium concentration and production from brine can create about 11 tons of carbon dioxide per ton of lithium, while mining lithium from spodumene ore releases about 37 tons of CO₂ per ton of lithium produced. 5
