Carbon capture and storage can help reduce fossil-fuel power-plant emissions. Here the authors show that the energy return on input of thermal plants with carbon capture is in general lower than ...

Pumped hydroelectric energy storage stores energy in the form of potential energy of water that is pumped from a lower reservoir to a higher level reservoir. In this type of system, low cost electric power (electricity in off-peak time) is used to run the pumps to raise the water from the lower reservoir to the upper one.

Background Virtual power plants (VPPs) represent a pivotal evolution in power system management, offering dynamic solutions to the challenges of renewable energy integration, grid stability, and demand-side management. Originally conceived as a concept to aggregate small-scale distributed energy resources, VPPs have evolved into sophisticated ...

energy sector, which currently accounts for just under 75 per cent of greenhouse gas (GHG) emissions, generated from the burning of hydrocarbons in the power, industry, transport, and heat sectors.¹³ As a result, the decarbonisation of the energy sector is the most urgent priority, in particular because at the

There have been wide concerns about the application potential of hydrogen and thermal storage in long-term low-carbon transition of the energy system including the power sector. The methods applied in these studies could be divided into two main categories: (1) simulation model based on the balance of energy supply and demand in a specific year ...
