

Can a stationary supercapacitor save energy in a trolleybus traction network?

The aim is to determine potential energy savings in the power supply system of the trolleybus traction network. The use of a stationary supercapacitor energy storage device and the reconfiguration of the power system was compared.

Why is installation of energy storage system easier in new trolleybuses?

Installation of energy storage system is easier into new trolleybuses in terms of technical challenges, because the proportion of the energy storage system can be already considered at trolleybus design and manufacture.

Do trolleybuses have AC traction drive systems?

The most important feature of trolleybuses that are equipped with AC traction drive systems is the ability to generate electrical braking energy. Instead of dissipating in brake resistors, this regenerated energy can be either transferred to other accelerating trolleybus or stored in energy storage system (ESS) for repeated use.

How much energy does a trolleybus use?

In the study and in other documents concerning the TROLLEY project, information about average energy consumption of 2.5 kWh/km can be found. Note: Our study comes to the number of 1.3 kWh/km. This result was obtained from a measurement on a smaller and lighter trolleybus 21 Tr, see Chap. 4.2.4, equation (4.8).

Are mobile and stationary energy storage systems suitable for electric transport?

Simulation-Based Comparisons of Mobile and Stationary Energy Storage Systems Applied for Electric Transport Abstract: Electric public transport infrastructure with its electric trolleybuses plays an important role in large-scale consumption of electrical energy.

Can a full recuperation energy balance be applied to a trolleybus traction?

Research on the analysis of the full recuperation energy balance are relatively rare, e.g. a riveting research paper is presented in , but it concerns the underground power system and its results cannot be applied to the trolleybus traction.

The most important feature of trolleybuses that are equipped with AC traction drive systems is the ability to generate electrical braking energy. Instead of dissipating in brake resistors, this ...

Request PDF | Impact of a Stationary Energy Storage System in a DC Trolleybus Network | In the context of urban transportation electrification, trolleybus systems can be modernized by using ...

The potential of this technology includes efficient and reliable operation, as the proven technology of the trolley bus is combined with modern energy storage technology. Owing to the onboard ...

In Ref. [19], an energy storage system including battery and supercapacitor is sized in order to recovery the braking energy of a trolley-bus; the sizing approach takes into account the aging-related degradation. In Ref. [20] a backward quasi-static modeling approach estimates the battery size on hybrid trolleybuses.

Energy storage devices, which allow the storage of recovered energy, are increasingly used. They include supercapacitors and flywheels. Today, a vast number of such storage devices are already applied in undergrounds, trams, and trolleybuses. As a result, the optimization of recuperation energy storage devices is growing in significance [1-6].

With the aim of reducing voltage drops in trolleybus networks even in case of high-power demands, the impacts of the inclusion of a mid-line stationary energy storage system to ...

The potential of this technology includes efficient and reliable operation, as the proven technology of the trolley bus is combined with modern energy storage technology. Owing to the onboard energy storage system, branches, crossings or other sections of track where electrification is costly or undesirable for aesthetic reasons can be designed ...

At Busworld Europe press conference in Kortrijk, IVECO BUS officially announces the launch of its new generation of trolleybuses, bringing the latest innovation with the "In-Motion Charge", which combines the electric 2-pole overhead lines with on-board battery energy storage.

The first sizing and placement study of wind and wind/PV hybrid systems as a renewable energy source for a trolleygrid system, both with and without storage, using detailed ...

DOI: 10.1109/ITEC53557.2022.9813948 Corpus ID: 250381662; Impact of a Stationary Energy Storage System in a DC Trolleybus Network @article{Paternost2022ImpactOA, title={Impact of a Stationary Energy Storage System in a DC Trolleybus Network}, author={Rudolf Francesco Paternost and Riccardo Mandrioli and Riccardo Barbone and Vincenzo Cirimele ...

Energy storage devices, which allow the storage of recovered energy, are increasingly used. They include supercapacitors and flywheels. ... coasting, and braking. A trolleybus, as opposed to rail vehicles, does not have dedicated lanes and moves along the road with other road vehicles. Hence, a factor determining a trolleybus movement is the ...

In the first part, we were interested in the sizing of the storage system for an application concerning the recovering braking energy of a trolleybus. Direct and inverse models of the kinematic chain were studied in order to define a design strategy based on the Ragon. The second part concerns the reliability of the storage system.

The findings of investigations of mathematical and physical models for an energy-efficient traction drive with the energy storage based on an electric double-layer capacitor are presented.

12.2 Choosing the type of energy storage system - ultrac apacitor vs. battery LiFePO 4 61 12.3 Conclusions and final recommendations 61 13. Appendix 64 ... 1.3 Energy requirements of trolleybuses The most energy consuming are the oldest trolleybuses, types 14 Tr / 14 TrM and the articulated 15 Tr type, which is electrically and power wise 2x ...

The technology, the PV system size, the trolleybus grid section, and the targeted outcome (improve the PV system utilization or reduce the voltage drops) have key role to the selection of the control strategy. The comparison of stationary energy storage systems to other energy storage systems cannot be straightforward.

1.3 Energy requirements of trolleybuses The most energy consuming are the oldest trolleybuses, types 14 Tr / 14 TrM and the articulated 15 Tr type, which is electrically and power wise 2x 14 ...

Those analyses have been used as a proposal for the fundamental design of trolleybus" onboard energy storage system. This article deals with practical implementation of modern energy monitoring system in Public Transport Company of Ústí nad Labem (PTCUL) city in the Czech Republic. The motivation for this project is based on the fact, that ...

define the best storage technology for the considered application. Keywords: electrified transport; energy storage; trolleybus; energy consumption; smart grid 1. Introduction Electrified transportation systems such as trams or trolleybuses are presently the preferred means of commuting within cities [1].

The most important feature of trolleybuses that are equipped with AC traction drive systems is the ability to generate electrical braking energy. Instead of dissipating in brake resistors, this regenerated energy can be either transferred to other accelerating trolleybus or stored in energy storage system (ESS) for repeated use.

making more efficient use of the trolley-bus catenaries to charge the batteries in-motion. The nine trolley:2.0 partners from public transport, industry, and re- ... functions for Stationary Energy Storage (SES) systems as a key element in smart trolley grids. The next stage of spatial development of low-emission trolleybus

The trolley bus will play an important role because today"s power electronics, sensor technology and excellent short term energy storage devices allow elegant solutions to transportation problems. They make the trolley bus operation easy and can also give a bit freedom from the catenary.

Abstract: This paper presents an energy management strategy for a battery-based stationary energy storage system (BESS) capable of supporting the operation of trolleybus power networks while adhering to the DC network"s current and voltage requirements, as well as considering the limitation of the C-Rate, to avoid stress on the battery itself. This work also proposes the ...

A better integration of trolleybus grids with renewable sources, energy storage, and the existing electric network of the urban area is necessary to increase the efficiency of the system and ...

Livermore, Calif., Nov. 8, 2021 - GILLIG LLC, a leading manufacturer of heavy-duty transit buses in North America, today announced the availability of a next-generation energy storage system for its battery electric bus. The new storage system provides up to 686 kWh of available energy, the largest capacity in a North American transit bus. "We recognized how critical range was to our ...

Actual savings will depend on regional energy costs and charging methods. With off-wire capability, trolley-electric buses can help reduce the need for, dependence on, and maintenance of overhead urban infrastructure. Off-wire operation range of ...

Fig. 3 shows the remodelled solo trolley bus for storage of braking energy in supercapacitors in the trolley bus city of Solingen. This system has 6 trolley bus lines in total and a power line network 100 km long. The supercapacitor equipment consists of a 700 V package with 288 supercapacitor elements with 2600 F each.

This article investigates the opportunities of integrating battery-assisted trolley buses into a given trolley bus network in public transportation. In this new generation of ...

by Bus Tours Magazine GILLIG LLC, a leading manufacturer of heavy-duty transit buses in North America, today announced the availability of a next-generation energy storage system for its battery electric bus. The new storage system provides up to 686 kWh of available energy, the largest capacity in a North American transit bus. "We recognized how ...

15MW Energy Storage System (ESS - energy stored 60MWh): Can\$ 12.36m ; 80 charging enclosures with 160 overhead pantographs: Can\$ 50m; Total: Can\$ 91m (min.) ... theoretically the trolley bus can be used without a battery at all. the price of batteries in electric buses is 80%. So trolley buses can be 80% cheaper per unit than electric buses.

PDF | On May 1, 2017, Pavel Jandura and others published Electric energy monitoring for applying an energy storage systems in trolleybus DC traction | Find, read and cite all the research you need ...
