An ISRU approach as a means of energy provision is to use the lunar regolith as the medium for thermal energy storage (Balasubramaniam et al., 2010a, Climent et al., 2014), similar to the underground thermal energy storage concept used on Earth. Heat can be stored in solid materials (thermal mass) in the form of sensible heat.

There is no coolant flow modeled in this example. The battery module is shorted with a 0.1mOhm resistor. There is an inrush current followed by cell quick discharge and heating up. Once the cell reaches the trigger temperature for thermal runaway and cell venting, the electrical circuit is disconnected to stop the electrical simulation.

The welding process represents an unintentional, but unavoidable, heat treatment in the form of soft annealing or tempering, but also hardening during the cooling of the melt. Particularly in the case of high-strength fine-grained structural steels, this leads to critical states of the mechanical-technological properties of the base material. In order to investigate ...
