

Background More than ever research into changes in the eye caused by long-term space flight is becoming the focus of the international and national space agencies National Aeronautics and Space Administration (NASA), European Space Agency (ESA) and German Aerospace Center (DLR). In addition to space radiation-induced cataract formation ...

Photos of space are everywhere online. Their beauty is dazzling, showing a universe awash in color and light. ... Some, like red and blue, capture light the human eye can see. Others, like ...

On Earth and in space, the major risk factor for a lens subluxation or dislocation is trauma [1]. Meer et al. [2] evaluated the types of ocular diagnoses and symptoms that astronauts experienced ...

Roam the Milky Way to find a selection of galaxies, stars, nebulae and more, and click for a Hubble's-eye-view of each object. To explore the skymap, scroll, double click, or pinch/swipe to zoom in and out. ... Start with a 360-degree video and discover the unique paths that led people to careers with the Hubble Space Telescope. Hubble Albums ...

NASA astronaut Scott Kelly floats near a window on the International Space Station in July 2015. Kelly spent a full year in space as part of an effort to see how long-duration spaceflight affects ...

GREENBELT, MARYLAND -- The first full-color images from NASA's sharpest eye in the sky, the flagship James Webb Space Telescope, were unveiled to the world today from the space agency's...

Two of the world's most powerful space telescopes have spied a spooky pair of galaxies in deep space, staring out like a pair of "blood-soaked" eyes just in time for Halloween.

James Webb Space Telescope. Webb is the premier observatory of the next decade, serving thousands of astronomers worldwide. It studies every phase in the history of our Universe. ... They appear as if blood is pumping through the top of a flesh-free face. The long, ghastly "stare" of their searing eye-like cores shines out into the supreme ...

Humanity has "eyes" that can detect all different types of light through telescopes around the globe and a fleet of observatories in space. From radio waves to gamma rays, this "multiwavelength" approach to astronomy is crucial to getting a complete understanding of objects in space. This image is of galaxy cluster Abell 2744.

NASA has revamped its "Eyes on the Solar System" 3D visualization tool, making interplanetary travel easier and more interactive than ever. More than two years in the making, ...

4 days ago#0183; NASA's James Webb Space Telescope and the Hubble Space Telescope have captured an astonishing cosmic phenomenon that resembles eerie "bleeding eyes" in space.. The image reveals striking red, almond-shaped clouds of space dust encircling two luminous orbs.NASA has invited the public to "Stare deeply at these galaxies.

The agency's newly upgraded "Eyes on the Solar System" visualization tool includes Artemis I's trajectory along with a host of other new features. ... and ride alongside no fewer than 126 space missions past and present - including Perseverance during its harrowing entry, descent, and landing on the Red Planet. ...

After decades of collecting data about how astronauts' vision is affected by spaceflight, scientists have identified a set of microgravity-induced changes to the human eye ...

In an interview with CNN, the four civilian crew members behind SpaceX's history-making Polaris Dawn mission reported different symptoms and ailments during their five-day journey last month.

Researchers believe that the LF perceived specifically by astronauts in space are due to cosmic rays (high-energy charged particles from beyond the Earth's atmosphere [3]), though the exact mechanism is unknown.Hypotheses include Cherenkov radiation created as the cosmic ray particles pass through the vitreous humour of the astronauts' eyes, [4] [5] direct interaction ...

The ESA (European Space Agency) Eye Tracking Device experiment researched mechanisms involved in this process and how the brain's frames of reference are altered in space. The experiment used a specially designed headset fitted with image-processing chips that track the eyes without interfering with the wearer's normal work. Results showed ...

Users may experience missions in real time, and "Eyes on the Solar System" also allows them to travel through time. The tool is populated with NASA data dating back to 1950 and projected to 2050. The playback rate can be sped up or slowed down.

Ocular trauma or other ocular conditions can be significantly debilitating in space. A literature review of over 100 articles and NASA evidence books, queried for eye related trauma, conditions ...

COLORADO, USA -- The crew from SpaceX's Polaris Dawn has made it safely back to Earth after the first commercial spacewalk. The mission reached a higher altitude than any human has traveled in ...

NASA has revamped its "Eyes on the Solar System" 3D visualization tool, making interplanetary travel easier and more interactive than ever. More than two years in the making, the update delivers better controls, improved navigation, and a host of new opportunities to learn about our incredible corner of the cosmos - no spacesuit required.

This will yield crisp images of space once the observatory launches. "This is the pre-launch first light, our first

Eyes in space

time seeing through the entire telescope," said Joshua Abel, the lead systems engineer for the Roman Space Optical Telescope Assembly at NASA's Goddard Space Flight Center in Greenbelt, Maryland.

Long-duration space travel may cause eye and brain changes that affect astronauts' vision. Scientists refer to this condition as spaceflight-associated neuro-ocular syndrome (SANS).

Another finding that has been noted is that over 30% of astronauts on the International Space Station (ISS) have reported clinical symptoms of dry eyes, manifested as irritation or foreign body ...
