

(flywheel kinetic energy) = $(K) \cdot (RPM)^2 \cdot (mass) \cdot (radius)$. Thus to maximize the energy storage of a flywheel we would focus on making it larger (increasing the radius) and faster, as the total energy will increase proportionally to the square of these factors. Note from @Ghanima's answer we know that efficiencies are already greater ...

Flywheel-Energy-Storage Systems in Energy Harvesting Systems Abstract: Two concepts of scaled micro-flywheel-energy-storage systems (FESSs): a flat disk-shaped and a thin ring-shaped (outer diameter equal to height) flywheel rotors were examined in this study, focusing on material selection, energy content, losses due to air friction and motor loss. For
