

What is a flywheel energy storage system?

Flywheel energy storage systems (FESS) are a great way to store and use energy. They work by spinning a wheel really fast to store energy, and then slowing it down to release that energy when needed. FESS are perfect for keeping the power grid steady, providing backup power and supporting renewable energy sources.

What is a flywheel power system?

Flywheel power systems, also known as flywheel energy storage (FES) systems, are power storage devices that store kinetic energy in a rotating flywheel. The flywheel rotors are coupled with an integral motor-generator that is contained in the housing. The motor-generator is used to store and then harness energy from the rotating flywheel.

Does Beacon Power have a flywheel energy storage system?

In 2010,Beacon Power began testing of their Smart Energy 25 (Gen 4) flywheel energy storage systemat a wind farm in Tehachapi,California. The system was part of a wind power/flywheel demonstration project being carried out for the California Energy Commission.

Why should you use a flywheel in a UPS system?

When flywheels are used with UPS systems (instead of batteries), they provide reliable protection against damaging voltage sags and brief outages. During power disruptions and outages, the flywheel provides the energy required to maintain the load allowing enough time for the emergency generator to start and take on the load.

What is a flywheel battery?

Flywheel battery. Image courtesy of VYCON During a power disruption, the flywheel will provide backup power instantly. When flywheels are used with UPS systems (instead of batteries), they provide reliable protection against damaging voltage sags and brief outages.

How to connect flywheel energy storage system (fess) to an AC grid?

To connect the Flywheel Energy Storage System (FESS) to an AC grid, another bi-directional converteris necessary. This converter can be single-stage (AC-DC) or double-stage (AC-DC-AC). The power electronic interface has a high power capability, high switching frequency, and high efficiency.

These early flywheel batteries were bad at storing energy for long periods. So flywheels at the time were used more for short-term energy storage, providing five-to-ten-minute backup power in data centers, for example. And Beacon Power, before its bankruptcy, focused largely on using flywheels as frequency regulators for power grids.

A flywheel-storage power system uses a flywheel for energy storage, (see Flywheel energy storage) and can be a comparatively small storage facility with a peak power of up to 20 MW.
