As with any material, rock particles only break when the applied tensile stress exceeds the tensile strength of the rock. However, in terms of comminution, the main interest is to derive reliable ways of assessing how a particular material breaks in a comminution device such as a crusher or a mill [] general, the breakage of rock particles is dependent on two factors: ...

The energy dissipation is split with 80% in rock-crusher collision (mechanisms 1, 2 and part of 4) and 20% in rock-rock collisions which is far from negligible (mechanism 3 and part of 4). This demonstrates that re-breakage from rock-rock collisions is an important minority component of the breakage process in the VSI.

Coke breeze is need to be crushed (normally in four roll crusher) to obtain the correct particle size (0.25 mm to minus 3 mm) for enhancing sinter productivity and reducibility. Less than 0.25 mm coke size has a negative effect on the productivity, while size fractions of - 3.15 mm to + 1.00 mm shows better yields.
