Exploring the concept of compressed air energy storage (CAES) in lined rock caverns at shallow depth: a modeling study of air tightness and energy balance. Appl Energy, 92 (2012), pp. 653-667.

The shock wave and stress wave were transmitted upward, resulting in stress wave superposition at the upper rock mass. Then, high-stress and high-energy zones were produced, so the damage extent to the rock mass at the top of the blasthole was larger than that of the rock mass at the bottom of the blasthole. Regarding the section near the mouth ...

Rocks prone to rock-burst generally have the following features (Li 2014): (1) high UCS and Young's modulus; (2) high amount of elastic energy storage before failure; (3) fast drop of stress-strain curve after peak stress, i.e., high energy release rate. Our test results demonstrate that after water saturation, both UCS and Young's ...
