Energy storage makes a critical contribution to the energy security of current energy networks. Today, much energy is stored in the form of raw or refined hydrocarbons, whether as coal heaps or oil and gas reserves. Since energy storage is far more efficient, power precursors are stored instead of electricity, and demand for generation varies.

Compressed air energy storage (CAES) is considered to be an important component of a renewable power grid, because it could store surplus power from wind turbines and solar panels on a large scale.
