The mathematical model is formulated and solved by STAR-CCM+. The mass flow rate is defined as the inlet boundary condition. The maximum mass flow rate of the cooling plate is 10 g/s in our work, and the corresponding Reynolds number ($Re = \rho w v D / \mu$) is calculated as 815. The Reynolds number determines the use of the viscous model.

How Thermal Energy Storage Works. Thermal energy storage is like a battery for a building's air-conditioning system. It uses standard cooling equipment, plus an energy storage tank to shift all or a portion of a building's cooling needs to off-peak, night time hours. During off-peak hours, ice is made and stored inside IceBank energy storage tanks.
