

The Li-argyrodites,  $\text{Li}_{6-x}\text{PS}_{5-x}\text{Cl}_{1+x}$  ( $x = 0, 0.3, 0.5, 0.7, \text{ and } 0.8$ ), are prepared to investigate the correlation of anion chemistry, structure, and composition with ionic conductivity. To create more Cl - at 4d sites, beyond the limit generated by spontaneous Cl-S exchange in  $\text{Li}_6\text{PS}_5\text{Cl}$ , more Cl is inserted into the structure to replace S at the 4d sites with ...

Flexible dielectrics with high energy density ( $U_e$ ) and low energy loss ( $U_l$ ) under elevated electric fields are especially attractive for the next-generation energy storage devices, e.g., high-pulse film capacitors. However, raising  $U_e$  by introducing high dielectric constant materials generally increases  $U_l$ , which is detrimental to the devices. To overcome this trade-off, a new strategy ...

Electrodeposition drives uphill reactions by applying electric energy instead of heating. These features may enable electrodeposition to meet some needs for battery fabrication that conventional technologies can rarely achieve. The latest progress of electrodeposition technologies in Li-based batteries is summarized.

The ever continuing and rising demand for portable and wearable electronics requires new types of energy storage devices that can accommodate the desired multi-functionalities, such as being bendable [1, 2], squeezable [[3], [4], [5]], stretchable [6, 7] and foldable [8], while maintaining their electrochemical performance deed, the design and ...

Lithium-ion batteries are an important power source and have dominated portable electronics [1, 2]. Nonetheless, the development of advanced energy-storage battery technology systems beyond conventional lithium-ion batteries is critical for various high demand energy storage applications such as electric vehicles and grid-level storage [3, 4]. Among ...

High-temperature dielectric polymers have a broad application space in film capacitors for high-temperature electrostatic energy storage. However, low permittivity, low energy density and poor thermal conductivity of high-temperature polymer dielectrics constrain their application in the harsh-environment electronic devices, especially under elevated temperatures.

All-solid-state Li-S batteries (ASSLSBs) have exhibited great promise as next-generation energy storage systems due to the elimination of the shuttle effect and flammability. However, the low reactivity of sulfur and poor solid-solid contact in the composite cathode result in limited electrochemical performances.

Glassy polymer dielectrics exhibit significant advantages in energy storage density and discharge efficiency; however, their potential application in thin-film capacitors is limited by the complexity of the production process, rising costs, and processing challenges arising from the brittleness of the material. In this study, a small amount of the polar monomer ...

Solid-state lithium (Li) metal batteries, employing solid electrolytes, with high energy density and enhanced safety are promising choices for next-generation electrochemical energy storage devices. However, the large interfacial resistances seriously hinder their commercialization.
