Lithium-ion battery (LIB) is one of rechargeable battery types in which lithium ions move from the negative electrode (anode) to the positive electrode (cathode) during discharge, and back when charging. It is the most popular choice for consumer electronics applications mainly due to high-energy density, longer cycle and shelf life, and no memory effect.

According to Yang et al. (2018), there are about 230,000 Mt of Li dissolved in the seawater and it is present in the Earth's crust at between 20 and 70 ppm by weight, mainly in igneous granite rocks. New clays like hectorite resources are rare. This creates a significant problem for scientists to develop novel approaches for efficient extraction processes from ...
