

Why do we need high-energy density energy storage materials?

From mobile devices to the power grid, the needs for high-energy density or high-power density energy storage materials continue to grow. Materials that have at least one dimension on the nanometer scale offer opportunities for enhanced energy storage, although there are also challenges relating to, for example, stability and manufacturing.

What are the applications of energy storage technology?

These applications and the need to store energy harvested by triboelectric and piezoelectric generators (e.g., from muscle movements), as well as solar panels, wind power generators, heat sources, and moving machinery, call for considerable improvement and diversification of energy storage technology.

Which cathode materials provide faster energy storage?

Many conventional cathode materials, such as  $\text{LiFePO}_4$  or  $\text{LiCoO}_2$ , when downsized to the nanometer scale, can provide faster energy storage compared with the bulk counterparts (43). However, the energy storage mechanism changes, with the surface redox reaction becoming a dominant process.

Can nanomaterials improve the performance of energy storage devices?

The development of nanomaterials and their related processing into electrodes and devices can improve the performance and/or development of the existing energy storage systems. We provide a perspective on recent progress in the application of nanomaterials in energy storage devices, such as supercapacitors and batteries.

Which conductive materials are used for energy storage?

More recently, highly crystalline conductive materials--such as metal organic frameworks (33 - 35), covalent organic frameworks (36), MXenes, and their composites, which form both 2D and 3D structures--have been used as electrodes for energy storage.

Which nanomaterials are used in energy storage?

Although the number of studies of various phenomena related to the performance of nanomaterials in energy storage is increasing year by year, only a few of them--such as graphene sheets, carbon nanotubes (CNTs), carbon black, and silicon nanoparticles--are currently used in commercial devices, primarily as additives (18).
