MPSs, encompassing MEGs, mobile energy storage systems (MESSs), and electric vehicles (EVs), present a promising solution for post-disaster power supply continuity. For the purposes of this study, we specifically focus on MEGs, considering their dual advantage of high-capacity power generation and mobility.

The PCM can be charged by running a heat pump cycle in reverse when the EV battery is charged by an external power source. Besides PCM, TCM-based TES can reach a higher energy storage density and achieve longer energy storage duration, which is expected to provide both heating and cooling for EVs [[80], [81], [82], [83]].

Stationary storage lacks flexibility, suffers from low utilization and from the risk of becoming a stranded asset. Power Edison addressed these issues by developing mobile energy storage platforms: TerraCharge(TM) and AquaCharge(TM) for mobile land-based and water-based mobile energy storage respectively.
