What makes a good lunar power system?

Ability to continue lunar surface operations regardless of time of lunar day. o Requires a complex power generation and energy storage strategy to provide continuous power. - Most likely cannot rely on just batteries/fuel cells to provide all power during lunar night. Highly distributed power system.

How can energy be stored on the Moon?

The environmental conditions of the lunar surface and its day-night cycle, with long periods of darkness, make the provision of energy a critical challenge. Several approaches have recently been considered to store and provide energy in the surface of the Moon by means of ISRU (In-Situ Resource Utilisation).

Why do we need a lunar power station?

The lunar power station eliminates issues with structural stability of large structuresimplied by large SPS. The 2-week lunar night is the most significant complication. Approaches to obviate this include the use of solar reflectors (lunettas) in lunar orbit to project solar energy to the lunar surface.

Why do we need a sustainable lunar surface power system?

Finite number of landers/flights with mass restrictions. Allows for consumers to grow and change over time. Sustainable power for the Lunar surface has some very unique challenges. Ability for the lunar surface power system to grow and evolve over time.

How will lunar surface power evolve over time?

Lunar surface power needs/useswill grow and evolve over time. Power strategy (generation /energy storage) will need to evolve over time. Maintainability/reusability is a key feature, especially for early science missions/payloads. Ability to continue lunar surface operations regardless of time of lunar day.

Can an ISRU-based system store heat and generate electricity for lunar missions?

We present a trade-off analysis of the options identified for an ISRU-based system to store heat and generate electricity for lunar missions with both robotic and human activities. A critical review of the energy requirements for a mission scenario consisting of long duration stays on the lunar surface has been carried out.

The heat from solar energy can be stored by sensible energy storage materials (i.e., thermal oil) [87] and thermochemical energy storage materials (i.e., CO 3 O 4 /CoO) [88] for heating the inlet air of turbines during the discharging cycle of LAES, while the heat from solar energy was directly utilized for heating air in the work of [89].

The moon"s cycle features four primary phases: the new moon, the first quarter or waxing moon, the full moon, and the last quarter or waning moon. In lunar gardening, each phase is better for certain types of gardening activities. Case in point: Because the moon"s gravitational pull is strongest during a new moon, its energy stimulates root ...
