However batteries cannot provide backup for a very long period of time and have limited charge/discharge cycles.

Why do ups have a filter and a surge suppressor?

A filter and a surge suppressor are sometimes used at the output of the UPS to avoid line noise and disturbance before being supplied at the output of the UPS. During normal mode operation, a battery charger will charge the battery bank, and at the same time the load is being fed by the power from main AC line.

How does a pumped storage power plant turbine work?

In the new design, the pumped storage power plant turbine will be integrated with a storage tank located on the seabed at a depth of around 400-800 m. The way it works is: the turbine is equipped with a valve, and whenever the valve is opened water flows in and turns the turbine.
