

The materials used for latent heat thermal energy storage (LHTES) are called Phase Change Materials (PCMs) [19]. PCMs are a group of materials that have an intrinsic capability of absorbing and releasing heat during phase transition cycles, which results in the charging and discharging [20].

Phase change materials (PCMs) can enhance the performance of energy systems by time shifting or reducing peak thermal loads. The effectiveness of a PCM is defined by its energy and power density--the total available storage capacity (kWh m -3) and how fast it can be accessed (kW m -3). These are influenced by both material properties as well as geometry of the energy ...

Incongruent Phase Change: Another major drawback of PCM storage system is incongruent phase change i.e. for an efficient implementation of the storage media, the phase change must match the operational temperature range. The incongruent melting in PCM reduces the reversibility of the phase change process and thus the heat storage capacity.
