

Can phase change material be used in sustainable cooling of data centers?

Contamination Control and Air-Conditioning Technology, 4 ( 2014), pp. 49 - 54 Application of phase change material in sustainable cooling of data centers Application of phase change material in sustainable cooling of data centers Plate type heat exchanger for thermal energy storage and load shifting using phase change material Energy Convers.

What are the different types of DC phase change cooling technology?

This paper divides the DC phase change cooling technology into four categories, independent heat pipe cooling, integrated heat pipe cooling, two-phase immersion cooling and cold storage systems. Independent heat pipe system can meet the cooling demand only through the heat pipe without any other mechanical cooling.

How effective is phase change cooling in DC?

Thus, efficient cooling approaches should be applied in DCs to ensure its safe operation and optimize its thermal environment and cooling efficiency. Phase change cooling (PCC) technology is regarded as one of the effective and widely-used cooling methods, which have been applied in DCs for several years.

How to improve efficiency of data center cooling system?

Yoshida et al. proposed a novel system incorporating cold supply to data center and heat supply to other facility. In this system, the heat from data center was stored in TES, and supplied to absorber together with post-heating source to enhance the efficiency of cooling system. 5.3. TES integrated free cooling system

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ( $< 10 \text{ W/(m} \cdot \text{K)}$ ) limits the power density and overall storage efficiency.

Why should data center cooling system be integrated with cooling system?

Requirement of high security and high cooling load in data centers leads to the development of data centers cooling system as a separate field. TES integrated with cooling systems in data center is usually applied to realize multi-targets including lower cost and higher operational security.

In a context where increased efficiency has become a priority in energy generation processes, phase change materials for thermal energy storage represent an outstanding possibility. Current research around thermal energy storage techniques is focusing on what techniques and technologies can match the needs of the different thermal energy storage applications, which ...

The immersion phase-change cooling technology utilizes the latent heat of the cooling liquid to dissipate heat by directly contacting the cooling liquid with the heat-generating electronic chip, which can meet the cooling requirements of current high heat flux density data centers. In this paper, the effect of different factors on the heat dissipation performance of ...

storage materials when electricity prices are high. The storage materials of choice are phase change materials (PCMs). Phase change materials have a great capacity to release and absorb heat at a wide range of temperatures, from frozen food warehouses at minus 20 degrees F to occupied room temperatures. These wide-ranging phase change

A PCM is typically defined as a material that stores energy through a phase change. In this study, they are classified as sensible heat storage, latent heat storage, and thermochemical storage materials based on their heat absorption forms (Fig. 1). Researchers have investigated the energy density and cold-storage efficiency of various PCMs [[1], [2], [3], [4]].

The global energy transition requires new technologies for efficiently managing and storing renewable energy. In the early 20th century, Stanford Olshansky discovered the phase change storage properties of paraffin, advancing phase change materials (PCMs) technology []. Photothermal phase change energy storage materials (PTPCESMs), as a ...

In recent years there have been increasing demand for Data Center (DC)s and High Performance Computing (HPC) on an international scale. In 2010 the DC sector was accountable for 1.3% of the world's electricity demand and the energy consumption was estimated to increase by 15%-20% pr. year [3], [4]. The need for efficient and modern ...

Phase change energy storage in data centers is primarily used for emergency cooling and does not typically support continuous cooling operations. The phase change-assisted direct ventilation cooling system investigated in this study aims to address this gap by enabling continuous cooling for data centers. By integrating the strengths of ...

DCs have the characteristics of 24/24 h, 365 days/year and globally very large scale, which annually cause much high energy use [3]. According to the statistics in 2019, DCs were responsible for approximately 3% of the electricity consumption and almost 4% greenhouse gas emissions globally [4] is predicted that the global energy demand for information and ...

This study provides valuable insights into applying energy storage heat exchangers in data centers. Key words: phase change energy storage, shell-and-tube heat exchanger, numerical ...

Data Center Solution; Solar Energy Storage; Projects. Melbourne CH2; ... From -100? to 1,100?, different type of PCM has different phase change temperature so that its energy-storing phase change process can be

sustained by specific natural hot/cold source without extra energy.

A simplified method to simulate tube-in-tank latent thermal energy storage with fin-enhanced phase change material in data center. Author links open overlay panel Lijun Liu a, Quan Zhang a ... energy saving and energy efficiency enhancement in cooling system of data center is urgent. Thermal energy storage is one of the most promising ...

DOE national labs have built exascale computing facilities with a Power Usage Efficiency (PUE) of 1.03, demonstrating state of the art techniques for data center efficiency. 4 DOE is also leading the Energy Efficiency Scaling for 2 Decades initiative, with a goal to increase the energy efficiency of the microelectronics that are needed for ...

In recent years, many scholars have conducted in-depth research on improving the energy consumption of the cooling system. G&#252;?&#252;l et al. [7] found the integration of a free cooling system with a photovoltaic generator can reduce the electricity efficiency from 1.8 to 1.1, which is beneficial for achieving zero energy consumption in data centers.

Phase-changing materials are nowadays getting global attention on account of their ability to store excess energy. Solar thermal energy can be stored in phase changing material (PCM) in the forms of latent and sensible heat. The stored energy can be suitably utilized for other applications such as space heating and cooling, water heating, and further industrial processing where low ...

3 &#0183; Thermal energy storage systems using PCM offer promising solutions for efficient thermal applications. This study aims to provide valuable insights into the PCM melting ...

Data centres (DCs) and telecommunication base stations (TBSs) are energy intensive with ~40% of the energy consumption for cooling. Here, we provide a comprehensive review on recent research on energy-saving technologies for cooling DCs and TBSs, covering free-cooling, liquid-cooling, two-phase cooling and thermal energy storage based cooling.

Phase change material (PCM)-based thermal energy storage significantly affects emerging applications, with recent advancements in enhancing heat capacity and cooling power. This perspective by Yang et al. discusses PCM thermal energy storage progress, outlines research challenges and new opportunities, and proposes a roadmap for the research community from ...
