This example shows that the energy for a phase change is enormous compared to energy associated with temperature changes without a phase change. Phase changes can have an enormous stabilizing effect (see figure below). Consider adding heat at a constant rate to a sample of ice initially at  $-20\text{ }^{\circ}\text{C}$ .

Phase change materials (PCMs) are ideal carriers for clean energy conversion and storage due to their high thermal energy storage capacity and low cost. During the phase transition process, PCMs are able to store thermal energy in the form of latent heat, which is more efficient and steadier compared to other types of heat storage media (e.g ...

Phase change temperature and latent heat. The energy storage capacities of the fabricated CPCMs were investigated. Fig. 10 shows the DSC curves of the CPCMs with different ratios of PE extruded at 5 rpm. Two phase change peaks can be seen respectively at 124.91 °C and 185.98 °C, indicating the phase change of HDPE and PE.
