The direct band gap (E_g) CdTe crystals have been in limelight in photovoltaic application (PV) since the optoelectronic properties such as E_g (1.49 eV), absorption coefficient (~10⁵ cm⁻¹), p-type conductivity, carrier concentration (6 × 10¹⁶ cm⁻³) and mobility (1040 cm²/(V s)) at the room temperature are reported that optimum for ...

The first report on an organic (excitonic) PV cell came as early as 1959, when Kallmann and Pope studied anthracene single crystal. The resulting cell exhibited an extremely low efficiency [13]. Till now, the resulting efficiency of the OPV cell with single active organic layer remained below 0.1% due to the formation of strongly bound excitons which need to be split to ...

This article presents a comprehensive review of different PV technologies presently available or going to be available in the near future on a commercial scale. Comparative analysis of these technologies is presented in terms of efficiency, and maturity of technology, Levelized cost of energy, ecotoxicity, and waste management.

The great strength of organic materials for photovoltaic applications is the strong absorption of light that enables the use of thin films on the order of 100 nm from nontoxic, relatively stable, plastic materials. ... The I-V characteristics of a solar cell are shown in Fig. 2. There is no intersection between the voltage characteristics of the PV generator and DC bus because DC bus voltage is much higher than V_{oc} [2]. The I-V characteristics (operating points of the PV generator) depend on the conductance of load [15]. If the conductance is large, the cell acts like a constant ...
