This illustration shows the approximate sizes of the planets relative to each other. Outward from the Sun, the planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune, followed by the dwarf planet Pluto. Jupiter's diameter is about 11 times that of the Earth's and the Sun's diameter is about 10 times Jupiter's.

Neptune from Voyager 2. Image credit: NASA/JPL. Neptune is the eight planet of our Solar System, and the farthest from the Sun. Like Uranus, it is both a gas giant and ice giant, composed of a ...

All the other planets will stand in any direction at various times. Planetary Order and the Zodiac The planets in order from Mercury to Neptune / Photo Credit Elements of this image furnished by NASA. All the planets orbit the Sun in the same flat pancake-like plane. Our Earth orbits in that plane, and so does our Moon whirling around us.

Space exploration and photography have come a long way since the first picture of Earth in 1946. ... The first missions to photograph planets from space traveled just 65 and 6,118 miles to capture ...

The planets in order from the Sun are based on their distance: Mercury, Venus, Earth (aka mother earth), Mars, Jupiter (father sky), Saturn, and Uranus with Neptune to round out at number 8! The solar system is an amazing place and there are plenty of planets to explore.

more photos and images. Woodcut showing the medieval view of the universe as a set of spheres set one inside another.

The Solar System [d] is the gravitationally bound system of the Sun and the objects that orbit it. [11] It formed about 4.6 billion years ago when a dense region of a molecular cloud collapsed, forming the Sun and a protoplanetary disc. The Sun is a typical star that maintains a balanced equilibrium by the fusion of hydrogen into helium at its core, releasing this energy from its ...

The solar system was formed around 4.6 billion years ago from a giant molecular cloud, known as the solar nebula. Over time, gravity caused the nebula to collapse, leading to the formation of the ...

1 day ago; Located at the centre of the solar system and influencing the motion of all the other bodies through its gravitational force is the Sun, which in itself contains more than 99 percent of the mass of the system. The planets, in order of their distance outward from the Sun, are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Four planets--Jupiter through ...

The Mini-World Brigade. Yes, I know. There's either more or less than nine planets. For puposes of my collage above, the 'dwarf planet' debate is moot: we're not going to have detailed photos of Eris or Pluto's other siblings any time soon.

Mercury is the first planet in our solar system. It is the closest planet to the Sun, located at an average distance of 36 million miles (58 million kilometres) from our star cause this small planet is so close to the Sun's harmful solar winds, it ...
