Geothermal energy is a base load power source similar to nuclear and coal-fired plants as it produces energy at a constant rate and so its power output remains consistent nearly 24 hours a day. It also has higher capacity factor than solar or wind power, which are dependent on sun to shine or the wind to blow, respectively.

The chapter contains 32 sections. Section 16.1 gives an introduction to the principle of energy supply. This section also provides the state of the art of the economics of various energy resources. Different types of fuels and their characteristics are discussed in Sect. 16.3. The conversion of different forms of energy has been explained in Sect. 16.5.

The power system has three main parts: generation, transmission, and distribution. This article focuses on power generation, where one form of energy is converted into electrical energy. Electrical energy is produced from various natural sources. Energy sources are classified into renewable and non-renewable types. Currently, most electrical energy is ...

Storage of electrical energy is a key technology for a future climate-neutral energy supply with volatile photovoltaic and wind generation. Besides the well-known technologies of pumped hydro, power-to-gas-to-power and batteries, the contribution of thermal energy storage is rather unknown.

This power plant was the first large, pumped storage plant in Sweden and also the largest pumped storage power plant in operation from 1979 to 1996 with a storage capacity of ~30GWh.
