Non-concentrating and concentrating solar collectors. Non-concentrating solar collectors. Solar energy systems that heat water or air in buildings usually have non-concentrating collectors, which means the area that intercepts solar radiation is the same as the area absorbing solar energy.Flat-plate collectors are the most common type of non-concentrating collectors for ...

Closed-loop, or indirect, systems use a non-freezing liquid to transfer heat from the sun to water in a storage tank. The sun's thermal energy heats the fluid in the solar collectors. Then, this fluid passes through a heat exchanger in the storage tank, transferring the heat to the water. The non-freezing fluid then cycles back to the collectors.
