Why is energy storage oversupply a problem?

The expansion is driven mainly by local governments and lacks coordination with new energy stations and the power grid. In some regions, a considerable storage oversupply could lead to conflicts in power-dispatch strategies across timescales and jurisdictions, increasing the risk of system instability and large-scale blackouts.

Is excessive energy storage a threat to China's power system?

But the risks for power-system security of the converse problem -- excessive energy storage -- have been mostly overlooked. China plans to install up to 180 million kilowatts of pumped-storage hydropower capacity by 2030. This is around 3.5 times the current capacity, and equivalent to 8 power plants the size of China's Three Gorges Dam.

Is excessive energy storage a problem?

Spyros Foteinis highlights the acknowledged problem that an insufficient capacity to store energy can result in generated renewable energy being wasted ( Nature 632 , 29; 2024 ). But the risks for power-system security of the converse problem -- excessive energy storage -- have been mostly overlooked.

Could battery storage replace natural-gas plants in California?

Indeed, the California storage projects could eventually replace three natural-gas facilities in the region, two of which are peaker plants. But much beyond this role, batteries run into real problems. The authors of the 2016 study found steeply diminishing returns when a lot of battery storage is added to the grid.

Can battery storage replace a power plant?

Today's battery storage technology works best in a limited role, as a substitute for "peaking" power plants, according to a 2016 analysis by researchers at MIT and Argonne National Lab. These are smaller facilities, frequently fueled by natural gas today, that can afford to operate infrequently, firing up quickly when prices and demand are high.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

As specific requirements for energy storage vary widely across many grid and non-grid applications, research and development efforts must enable diverse range of storage ...

So the experts say that we could probably convert the grid 80% to renewable - that's wind and solar - without

The biggest problem with wind and solar energy is that they're intermittent. There might be violent winds one day, and calm skies the next; broiling sunshine on Monday and 100% cloud cover ...

Fluctuating solar and wind power require lots of energy storage, and lithium-ion batteries seem like the obvious choice--but they are far too expensive to play a major role.
