Compressed air energy storage is a large-scale energy storage technology that will assist in the implementation of renewable energy in future electrical networks, with excellent storage duration, capacity and power.

Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distributioncenters. In response to demand, the stored energy can be discharged by expanding the stored air with a turboexpander generator.

Compressed Air Energy Storage (CAES) can store surplus energy from wind generation for later use, which can help alleviate the mismatch between generation and demand. In this study, a small-scale CAES system, utilizing scroll machines for charging and discharging, was developed to integrate into a wind generation for a household load.
