The International Energy Agency has highlighted the need for significant increases in renewable energy deployment to meet these climate goals, projecting that renewable power capacity must double by 2030. This means an annual increase of around 300 GW over the next decade, compared to 2020's record of 250 GW of added renewable energy capacity.

The Zenergy Podcast interviews global climate leaders with prior guests including the founders of some of the world's largest renewable energy and electric vehicle companies including ...

Nexamp added energy storage to two existing community solar farms in the grid-constrained ISO New England market. The Clark Road community solar farm (pictured) has 7.1 MW of solar capacity and 3 MW/6.1 MWh of storage.

Bringing together industry leaders, innovators and global thinkers, Future Energy Insights by the World Future Energy Summit takes an in-depth look at renewable energy and sustainability. Featuring lively debate and passionate discussion, the series covers six core topics: clean energy, water scarcity, smart cities, circular economies, waste ...

A decarbonized grid, powered primarily by solar and wind, will require a lot of energy storage. Lithium-ion batteries, while the technology du jour, won't come close to solving the problem on their own.. The U.S. could need 125-680 GW of long-duration storage capacity --up to 12 hours-- by 2050 to support a grid dependent on intermittent renewables, according ...

AI is everywhere. It's impossible to avoid. But parsing revolutionary technology from marketing hype has never been more challenging. So, what does AI really mean for clean energy? Beneath the frothy layer of pretenders and contenders lie potentially game-changing applications for grid management, asset monitoring and optimization, and market participation.
