In a solar PV system, the hybrid energy storage system (HESS) is designed by combining a supercapacitor with a battery to increase the energy density of the system. This system has more advantages than the individual use of a supercapacitor or battery. The stress on batteries can be reduced by using a hybrid system of supercapacitors and batteries.

"The report focuses on a persistent problem facing renewable energy: how to store it. Storing fossil fuels like coal or oil until it's time to use them isn't a problem, but storage systems for solar and wind energy are still being developed that would let them be used long after the sun stops shining or the wind stops blowing," says Asher Klein for NBC10 Boston on MIT's "Future of ...

Supercapacitors are also employed as energy storage devices in renewable generation plants, most notably wind energy, due to their low maintenance requirements. Conclusion. Supercapacitors are a subset of electrochemical energy storage systems that have the potential to resolve the world's future power crises and minimize pollution.

There are three main types of MES systems for mechanical energy storage: pumped hydro energy storage (PHES), compressed air energy storage (CAES), and flywheel energy storage (FES).
