Agencies are encouraged to add, remove, edit, and/or change any of the template language to fit the needs and requirements of the agency.

and safety requirements for battery energy storage systems. This standard places restrictions on where a battery energy storage system (BESS) can be located and places restrictions on other equipment located in close proximity to the BESS. As the BESS is considered to be a source of ignition, the requirements within this standard

The base ITC rate for energy storage projects is 6% and the bonus rate is 30%. The bonus rate is available if the project is under 1MW of energy storage capacity or if it meets the new prevailing wage and apprenticeship requirements (discussed below). New Section 48E Applies ITC to Energy Storage Technology Through at Least 2033

In this entry, the possibility of composing a high-energy, high-power hybrid energy storage system is presented based on the analysis of inherent characteristics of different energy storage methods. The basic components in this system are chemical batteries, ultracapacitors, and flywheels.

o Battery energy storage system specifications should be based on technical specification as stated in the manufacturer documentation. o Compare site energy generation (if applicable), and energy usage patterns to show the impact of the battery energy storage system on customer energy usage. The impact may include but is not limited to:

Flow batteries: Design and operation. A flow battery contains two substances that undergo electrochemical reactions in which electrons are transferred from one to the other. When the battery is being charged, the transfer of electrons forces the two substances into a state that's "less energetically favorable" as it stores extra energy.
