I created this map of the solar system and though some of you might like it. The map contains all the planets and their moons (which have an official name, all the moons of of the outer planets are not included), some dwarf planets, trojans, and some important asteroids.

Hey folks, I'm considering setting a story in our solar system around the year 24-2600 or so, but I'm concerned about ripping other authors off; I've only read a small amount of fiction that's set in our solar system in the near- to mid-future, and I want to make sure I don't just make a clone of the stuff I've read.

This sci-fi adventure movie primarily concerns the Sun, hence the title, but it does take place reasonably close to the Solar System's first and smallest planet, the barren Mercury. In Sunshine, the Sun is dying and Earth is freezing, so physicist Robert Capa takes part in a mission aboard the Icarus II to set off a bomb and kickstart the Sun ...

experience with it and cannot tell you if it really does what you need it to do, but there are some star maps among the example ...

I assume you mean because of orbits, but maps of the solar system work just fine to convey information by aligning planets in a straight line. Sure, if you actually needed to know what direction to go to reach a destination you'd need a constantly up to date map, but this advanced sci fi you'd probably have computers doing that anyway.
