Energy storage flywheel systems are mechanical devices that typically utilize an electrical machine (motor/generator unit) to convert electrical energy in mechanical energy and vice versa. Energy is stored in a fast-rotating mass known as the flywheel rotor. The rotor is subject to high centripetal forces requiring careful design, analysis, and fabrication to ensure the safe ...

The innovation introduced in this study concerns two aspects: the first one is the using of a small-scale CAES system integrated with a TES (thermal energy storage) unit with inter-cooling compression and inter-heating expansion; the second one is the cooling energy production, that is obtained by the cold air (3 &#176;C) at the turbine outlet of the CAES system.
