

Sodium-ion battery cost

What is a sodium ion battery?

Overall, we provide a broad and interdisciplinary perspective on modern batteries and future directions for this field, with a focus on sodium-ion batteries. Sodium-ion batteries are an appealing alternative to lithium-ion batteries because they use raw materials that are less expensive, more abundant and less toxic.

How much does sodium ion cost per kWh?

However, the second generation sodium ion could reach \$40 per kWh. Iron LFP batteries could get to \$50/kWh with really high volume and efficiency at the cell level. The future low price of sodium ion would make for insanely cheap fixed storage products like the Tesla Megapack and Powerwalls. They also do not have practical material limits.

Are sodium-ion batteries worth it?

Sodium itself is extremely abundant and cheap. But these batteries have lagged behind lithium-ion batteries because they have relatively low energy density -- the amount of electrical energy that can be stored per unit of weight. Now CATL says its research has paid off with a new sodium-ion battery with an energy density of 160 Wh/kg.

How much will sodium ion batteries cost in 2028?

Assuming a similar capex cost to Li-ion-based battery energy storage systems (BESS) at \$300/kWh, sodium-ion batteries' 57% improvement rate will see them increasingly more affordable than Li-ion cells, reaching around \$10/kWh by 2028.

Are sodium ion batteries good?

CATL and other battery manufacturers have been researching sodium-ion batteries for several years. Lithium-ion batteries are great but need relatively expensive raw materials such as lithium, nickel, or cobalt. They also do not perform well at low temperatures, as any EV owner who lives in a cold climate can attest.

Are sodium batteries cheaper than lithium ion batteries?

Unlike lithium, sodium can be produced from an abundant material: salt. Because the raw ingredients are cheap and widely available, there's potential for sodium-ion batteries to be significantly less expensive than their lithium-ion counterparts if more companies start making more of them.

Sodium could be competing with low-cost lithium-ion batteries--these lithium iron phosphate batteries figure into a growing fraction of EV sales. Take a tour of some other non-lithium-based ...

The company is in the process of launching a sodium ion battery for electrochemical energy storage and transportation in Q3 2022. It is working with Faradion, a sodium ion battery producer, to boost its manufacturing and sales efforts. The company's sodium ion battery is very slim, taking on the shape of a

square pouch.

The search for advanced EV battery materials is leading the industry towards sodium-ion batteries. The market for rechargeable batteries is primarily driven by Electric Vehicles (EVs) and energy storage systems. In India, electric two-wheelers have outpaced four-wheelers, with sales exceeding 0.94 million vehicles in FY 2024.

Stockholm, Sweden - Northvolt today announced a state-of-the-art sodium-ion battery, developed for the expansion of cost-efficient and sustainable energy storage systems worldwide. The cell has been validated for a best-in-class energy density of over 160 watt-hours per kilogram at the company's R& D and industrialization campus, Northvolt Labs, in Västerås, Sweden.

Sodium, which is common in ocean water and soda ash mining, is an inherently more environmentally friendly battery material. The LESC research has made it a powerful one as well. Innovative architecture. To create a sodium battery with the energy density of a lithium battery, the team needed to invent a new sodium battery architecture.

More importantly, successful prepn. of a dehydrated iron hexacyanoferrate with high sodium-ion concn. enables the fabrication of a discharged sodium-ion battery with a non-sodium metal anode, and the manufg. feasibility of low cost sodium-ion batteries with existing lithium-ion battery infrastructures has been tested.

For the first, pack-level cost based on BatPac calculations of NMC622|SiC, NMC622|C and LMO|C ranging from 234 to 259 \$ (kW h)⁻¹ are reported for stationary application. In all three evaluated scenarios, LIBs are shown to undercut sodium-ion battery cost levels at current raw material prices. Nevertheless, the authors underline potential ...

It is currently the only viable chemistry that does not contain lithium. The Na-ion battery developed by China's CATL is estimated to cost 30% less than an LFP battery. Conversely, Na-ion batteries do not have the same energy density as their Li-ion counterpart (respectively 75 to 160 Wh/kg compared to 120 to 260 Wh/kg). This could make Na ...
