

Are HCD SOEC systems a sustainable solution for hydrogen production?

See all authors Solid oxide electrolysis cell (SOEC) systems operating at high current densities (HCD) are emerging as sustainable and efficient solutions for hydrogen production. However, the performance of the HCD SOEC systems in endothermic mode, which requires significant external energy, is underexplored.

Can SOEC produce hydrogen at a lower electrical energy demand?

These studies showed that hydrogen could be produced by SOEC at a considerably lower electrical energy demand. Heat produced from partial oxidation or total oxidation at the anode can be utilized for SOEC hydrogen production since electrolysis is an endothermic process.

Can SOEC improve hydrogen production efficiency?

In addition, there are growing interests in integrating SOEC with nuclear energy and geothermal energy technologies to optimize the hydrogen production efficiency. In this work, the technological development of hydrogen production by SOEC is reviewed.

How much hydrogen does a SOEC produce a day?

The system demonstrates a hydrogen production rate of 7.76 ton/day using the SOEC and a power generation of 54.3 MWh in the SOFC for peak demand shaving, yielding an overall round trip efficiency of 74.2%.

Is SOEC a practical solution for Clean Hydrogen production from renewable resources?

SOEC offers a practical solution for clean hydrogen production from renewable resources. In this work, a comprehensive review of the state-of-the-art SOEC technology for hydrogen production is presented. The developments of important SOEC components, such as electrolyte and electrode materials, have been reviewed.

What is the role of SOEC in hydrogen economy?

In hydrogen economy, it plays a significant role in hydrogen value chain by producing hydrogen that powers the transportation and industrial sector. SOEC has been widely used for conversion of H_2O and CO_2 to syngas, which acts as a precursor for petroleum industries.

Renewable energy storage and grid stabilization
electrical energy (e-), chemical energy (H_2 or synthetic fuels) mechanical/potential ... SOEC mode (hydrogen production): Projected degradation rate ~ 30%/1000 hrs Long-term test results ...

The critical factors for designing an economical hydrogen storage plan include: i) the proportion of the utilized hydrogen for power generation in the SOFC to the total produced ...

Solar energy-powered electrolytic water splitting represents a promising avenue for hydrogen

production. However, current technologies for solar-driven hydrogen generation still face the challenges such as low efficiency and significant fluctuations in solar energy availability. This paper proposes a full-spectrum solar hydrogen production system ...

In 2020, hydrogen production accounted for 2.5% of global CO₂ emissions in the industry and energy sectors [9]. That is why methods to decarbonise hydrogen production, like carbon capture, utilisation, and storage (CCUS) and water electrolysis powered by renewable sources, are seen as a more promising way of hydrogen production in the near future.

Originator. Record #: 16014 Date: 2/17/16 Title: Hydrogen Production Cost from Solid Oxide Electrolysis s: David Peterson, Eric Miller Peer Reviewed by Industry Representatives: Annabelle Brisse, Joseph Hartvigsen, Randy Petri, and Greg Tao Approved by: Sunita Satyapal Date: 5/31/16 Item The projected cost to produce hydrogen from high-temperature solid oxide ...

Storage costs for chemical energy as hydrogen, methane in caverns, or liquids are today at the level of <1 euro per kilowatt-hour ... The production capacity of an SOEC plant is directly proportional to the overall active area of the electrolysis stacks and to the applied current density. ... Hydrogen Energy 45, 8955-8964 (2020). 10.1016/j ...

strong expected future demand for clean hydrogen production using clean electricity powered electrolysis. ... SOEC systems also pose challenges. Several key points emerge from this assessment: 1. The maturity of solid oxide electrolysis technology is ... and long-term energy storage. For these sectors, hydrogen offers several potential advantages:

Furthermore, the reversible application of SOEC technology, as demonstrated by FuelCell Energy and Sunfire's deployment at the Salzgitter steel plant, showcases the dual utility of SOECs in hydrogen production and electricity generation, addressing the critical need for versatile and sustainable energy solutions [114]. This application ...

This review aims to enhance the understanding of the fundamentals, applications, and future directions in hydrogen production techniques. It highlights that the hydrogen economy depends on abundant non-dispatchable renewable energy from wind and solar to produce green hydrogen using excess electricity. The approach is not limited solely to ...

This paper highlights the emergence of green hydrogen as an eco-friendly and renewable energy carrier, offering a promising opportunity for an energy transition toward a more responsible future. Green hydrogen is generated using electricity sourced from renewable sources, minimizing CO₂ emissions during its production process. Its advantages include ...

Hydrogen production by seawater electrolysis is significantly hindered by high energy costs and undesirable

detrimental chlorine chemistry in seawater. In this work, energy-saving hydrogen ...

The SOEC hydrogen production system introduced herein absorbs surplus wind power fluctuations and exhaust gases from HTGR technology, reducing the energy consumption ratio of electricity in the hydrogen production process and effectively enhancing the energy conversion efficiency of the HTGR and the electrolytic conversion efficiency of hydrogen.

The typical flow scheme of the SOEC H₂ production system is presented in ... the possibility of SOECs working in reversible operation so a single unit allows for both energy storage and generation permits a complete green power plant to achieve zero-energy building and carbon neutrality targets. ... "Hydrogen production using nuclear energy ...

A significant knowledge gap persists regarding the integration of spectral beam splitting and photothermal energy storage in solar hydrogen production systems, as well as its impact on energy efficiency and the environment. ... Compared to the PV-SOEC hydrogen production system, the complexity of proposed system increases, and then the cost of ...

Storage costs for chemical energy as hydrogen, methane in caverns, or liquids are today at the level of <1 euro per kilowatt-hour (kWh) (excluding conversion costs), whereas the cost of battery storage is expected ...

The large-scale development of green hydrogen energy offers a critical solution to the challenges posed by greenhouse gas (GHG) emissions and global climate change. Conducting an early technical and economic evaluation of an efficient and safe hydrogen production, storage, and transportation pathway is challenging

Demonstrate the potential of solid oxide electrolysis cell (SOEC) systems to produce hydrogen at a cost of less than \$2.00/kg H₂, exclusive of delivery, compression, storage, and dispensing. Improve SOEC stack performance to achieve >95% stack electrical efficiency based on the ...

High-temperature solid oxide electrolyzer cell (SOEC) has great potential for efficient and economical production of hydrogen fuel. In this paper, the state-of-the-art SOEC ...
