

Microinverters are small devices attached to each solar panel that convert DC electricity into alternating current (AC) electricity, which is used in homes. Unlike traditional string inverters, which are only as strong as the weakest solar panel, microinverters allow each panel to operate independently, maximizing efficiency and performance.

Unlike string inverters, which convert DC power into AC power for a group of connected panels, microinverters are connected to each individual panel. Installers usually mount the microinverters onto the back of the solar panel, but they can also be placed next to the panel on your solar racking system.

Solar power inverters play an equally important role in a solar system: they convert the electricity your solar panels create into a form that can be used by the appliances, lighting, and other electronics in your home.

Find the best solar inverter for your home based on expert and consumer reviews. Inverters maximize solar panel output and convert power from DC to AC, making them an integral part of home solar power systems.

Micro-inverters are commonly connected to and installed at the site of, or behind, each individual solar panel in an array. Most micro-inverter makes are installed in the field, while some come panel-integrated by the manufacturer.

Individual solar microinverters are installed underneath each solar panel in your system. By converting DC to AC as close to the source as possible, microinverters can reduce the property risks of high-voltage electricity and allow your solar panels to ...

Solar inverters have one core function: convert the direct current (DC) solar panels generate into an alternating current (AC) used in your home. There are two main types of home solar inverters: Microinverters attach to the back of each panel and are best for complex solar installations.

A solar power inverter's primary purpose is to transform the direct current (DC) electricity generated by solar panels into usable alternating current (AC) electricity for your home. Because of this, you can also think of a solar inverter as a solar "converter."
